TITLE: [A circuit for phase and frequency comparison] CZ Pat. No. PV 6912-64,  
Class 21a

SOURCE: Vynalezky, no. 4, 1966, 10

TOPIC TAGS: phase shift analysis, frequency shift, signal analysis, pulse signal, transistorized circuit

ABSTRACT: This patent introduces a circuit for comparing the phase and frequency of a signal with square synchronizing pulses with the same parameters of a second signal which has odd symmetry with differing active and retrace intervals. The input circuit of the comparator has two outputs. When the first signal is fed to the input, a square-wave signal is generated at each output in synchronization with the input signal and in opposition with the other output signal. A capacitor and diode are connected in series at the first output, while a second capacitor and diode are connected in the same way at the second output. The second signal for comparison is fed to the tie point between the interconnected series circuits. The output voltage is proportional to the frequency difference or phase shift between the two series circuits at the tie points between capacitor and diode. This resistor is shunted by an additional

Card 1/2

I. 38836-66

ACC NR: AP6013151

capacitor. The input circuit consists of two transistors ( $T_1$  and  $T_2$ ) of opposing conductivity with emitters connected to opposite terminals (+U-U) of the voltage supply, and collectors connected to a neutral point (A). The first signal for comparison is fed through a capacitor ( $C_5$ ) to the base of the first transistor ( $T_1$ ). The base of the second transistor ( $T_2$ ) is connected through a capacitor ( $C_6$ ) to the tie point ( $A_4$ ) between two resistors ( $R_5, R_6$ ) connected in series between the collector of the first transistor ( $T_1$ ) and a neutral point ( $A_0$ ). Prague, Casopis Lekarů Ceských, Vol 105, No 43, 28 Oct 66, pp  
1161 - 1164

Abstract: Centripetal transmission of pain excitation is described. The function of thin myelinated fibers A delta to epsilon and non-myelinated fibers C is discussed. The influence of the endocrine glands in the perception of pain is evaluated. Mechanism of pain reception in less developed animals is reviewed. Study which the author made of the reaction of the electrical resistance of the skin during painful excitation is discussed. Induction of hemi-cranial seizures by histamine injection in patients suffering from migraine is described. Author's study of nociceptive induction of painful vertebrogenic syndromes is reviewed. The importance of the condition of the higher nervous activity in the perception of pain is discussed. No references.

"Acupuncture in Discogenic Radicular Affections and Polyreographic  
Reactions of Involved Segments."

Prague, Ceskoslovenska Neurologie, Vol 26, No 2, 1963; pp 104-111.

Abstract [English summary modified]: An attempt to evaluate scientifically  
acupuncture whose "undeniable" successes (especially in trigeminal neuralgia  
and discopathies) one of the authors saw during a recent study trip in Red  
China; 42 patients with discogenic radicular syndromes involving primarily  
L5 and S1 were treated with an average of 3 applications on the points  
prescribed by traditional Chinese medicine; clinical evaluation of results  
was supplemented by polyreographic and skin temperature change

1/2

Prague, Ceskoslovenska Neurologie, Vol 26, No 2, 1963; pp 104-111.

recordings during and after as well as before treatment. Clinically results excellent in 12, good in 18, no change in 10. Electrical skin resistance changes during and after treatment were recorded in 23: in 5, paradoxical increase, in 9 no change, in 9 decrease, concomitant with clinical improvement. Skin temperature changes did appear in 16 out of 17 so observed. Authors conclude that effect on the vasomotor reflexes is undeniable but it is only one of the factors involved in acupuncture. Four Soviet, 1 Western, 8 Czech (including thesis by author S.F.) ref's. Also 6 Graphs and 2 tables.

TITLE: Mediator and higher nervous mechanisms in vasomotor reactions in vertebrogenic lesions

SOURCE: Ceskoslovenska neurologie, no. 3, 1965, 213-219

TOPIC TAGS: neurology, reflex activity, clinical medicine

ABSTRACT:

Plethysmographic studies of vasomotor reflexes in 98 lumbosacral and 58 cervical lesions are described. The reaction depends on the intensity of the pain suffered. The mediator mechanism of the inverse vasomotor reactions and its localization are discussed. It appears that they have a cholinergic mechanism. Quality of stimulation is decisive in inverse vasodilator reactions and in their blocking by atropine. It appears that the higher nervous centers and not the peripheral vasomotor synapse are responsible for inverse vasomotor reactions. Orig. art. has: 4 figures. [JPRS]

TITLE: Stimulus modality and inverse vascular responses [This paper was presented at the Third Interdisciplinary Conference on Experimental and Clinical Study of Higher Nervous Functions held in Marianske Lazne from 19 to 23 October 1964.]

SOURCE: Activitas nervosa superior, v. 7, no. 2, 1965, 188-189

TOPIC TAGS: drug effect, man, blood circulation, neurology, nervous system drug

ABSTRACT: Influence of the quality of the stimulus on inverse, vasodilator responses in painful vertebrogenic syndromes was studied. 55 healthy subjects and 25 patients with an algetic reticular syndrome were tested for the vascular responses elicited by standard stimuli. In healthy subjects, vasodilator response occurred in 10.9 to 16.1% in algetic patients. An atropine injection changed the inverse vasodilator response to normal vasoconstriction to nociceptive and sound stimuli in 96 and 72%, respectively. In inverse vasomotor responses important part is played by higher nervous activity components. [JPRS]

AUTHORS: Leziva, J. M., Lidařik, M., and Starý, S.

TITLE: Effect of structure of various polyphenols on the properties of epoxy resins

PERIODICAL: Plaste und Kautschuk, v. 8, no. 4, 1961, 171-174

TEXT: The effect of structure of the phenolic component on the properties of epoxy resins of medium molecular weight was studied. Preparation of the phenolic component: The bisphenols (2)-(9) in Table 1 were prepared by condensation of the corresponding ketone and aldehyde, respectively, with phenol or o-cresol at a molar ratio 1:1.78 in the presence of 72.5% H<sub>2</sub>SO<sub>4</sub> and a small amount of toluene and thioglycolic acid at 40°C; (12) by melting 62 g of 2-methyl-4-tert-butyl-6-methylol phenol with 105 g of 2-methyl-4-tert-butyl phenol, addition of 5 g of HCl concentrate at 90°C, heating to 120°C for one hour, distilling off in vacuum of the nonreacted 2-methyl-4-tert-butyl phenol, rinsing of the residue with petroleum ether, and recrystallizing from gasoline; (13) by melting 42 g of 4-tert-butyl-2,6-dimethyl phenol with 280 g of 4-tert-butyl phenol, addition of 7 ml of HCl concentrate, slow  
Card 1/8

Effect of structure ...

G/004/61/008/004/001/003  
B120/B206

solidifying under stirring and cooling, distilling off the nonreacted 4-tert-butyl phenol through water vapor distillation, and double recrystallizing of the residue from ethanol. Preparation of epoxy resins: To a mixture of 1 mole of bisphenol, 1.33 moles of epichlorohydrin and dioxane (30%, related to bisphenol), 1.40 moles of NaOH (in 30% solution) was added dropwise at 70°C in the course of 2 hr, then kept for 2 hr at 75°C, and then the mixture butanol - xylene (1:3) was added in the same proportion by weight as the original bisphenol. In the bisphenols (2) and (11) (see Table 1) dioxane had to be used as solvent, in (1) the part insoluble in butanol - xylene was dissolved by addition of dioxane. Two layers formed which were separated, the resin solution was cooled, neutralized with CO<sub>2</sub>, dehydrated by azeotropic distillation, filtered, and the solvent was finally removed at 170°C in vacuum. The resins from bisphenols (6) and (10) were dried by means of silica gel. Properties of epoxy resins as dependent on the structure of the phenolic component: see Table 2. Explanations: Column 9: the cementing was hardened at 180°C for 2 hr, and the properties were rated according to Lidarik, M., Plaste und Kautschuk, v. 7 (1960), p. 55. Column 12: test of the produced epoxy resins for their suitability as stoving lacquers. These were produced according to Swiss patent 257115 of the Ciba AG (August 30,

Card 2/8

Effect of structure ...

G/004/61/008/004/001/003  
B120/B206

1949). Stoving lacquers made from the very easily accessible 2,2-bis(4-hydroxy-3-methyl-phenyl)-propane of good yield show unsatisfactory properties, even after combination with a resin from dimerized fatty acids and triethylene amine. Casting resins from 2,2-bis(4-hydroxy-3-methyl-phenyl)-propane, hardened with phthalic anhydride, show insufficient strength properties as compared with those from 2,2-bis(4-hydroxy-phenyl)-propane (the values of resins made from 2,2-bis(4-hydroxy-phenyl)-propane are in parentheses): tensile strength 147 (460-510) kg/cm<sup>2</sup>, flexural strength 541 (700-810) kg/cm<sup>2</sup>, impact flexural strength 5 (16-24) kg/cm<sup>2</sup>; the resistance to heat according to Vicat is about equal: 116(115)°C; the electric insulation properties are inferior: dielectric constant 4.58(3.66), loss factor at 800 cycles, 0.069(0.0011), resistivity 10<sup>15</sup>(10<sup>16</sup>)Ω·cm. Table 3 shows the measured values for the deformation test according to Höppler after hardening the resins with phthalic anhydride (one molecule for 2 epoxy groups). Preparation of test pieces: the resin was heated to 120°C, the phthalic anhydride was stirred in for 10-15 min, the mass was then poured into the mold, and the test pieces (cylinder: 11.5 cm diameter, 8 cm height) were dried at 120°C for 17 hr. Conclusions: The epoxy resin properties strongly depend on the structure of the initial polyphenols. 2,2-bis(4-hydroxy-phenyl)-propane produces resins of universal applicability. Resins of special properties

TITLE: Production of epoxy resins

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 1, 1963, 539, abstract 1T130 (Czechosl. patent 100282, July 15, 1961)

TEXT: Epoxy resins are obtained when epihalohydrin and its derivatives react in the presence of a Friedel-Crafts catalyst with mono- and poly-atomic phenols, alcohols, bisphenols, or phenol resins, and the resultant mixture of halohydrin ethers of phenol compounds (or the mixture of separately prepared halohydrin ethers) and alcohol is dehydrohalogenated in high-alkaline medium. By way of example, 1 mole diene and 10 moles ethyl chlorohydrin are mixed in a flask and heated under stirring to 70°C. 1% triethanol amine (related to diene) and 3% NaCl in 15% aqueous solution are added. The mixture is heated to boiling and then left for 4 hrs. Then, 0.12 mole glycerin-tris-chlorohydrin ether is introduced, which has been prepared by reaction of 3 moles ethyl chlorohydrin and 1 mole

Card 1/2

glycerin with  $\text{BF}_3$  catalyst by heating to  $65-75^\circ\text{C}$  for 3 hrs. To the mixture of chlorohydrin ethers, 2.36 moles NaOH in the form of 20% aqueous solution is added dropwise within 3 hr 45 min and left for 15 min. Then, 300 g benzene is added, the aqueous layer is separated and the resin solution is neutralized with  $\text{CO}_2$  to pH 6.5. The solution is dried with calcined soda and filtered, and the transparent filtrate is separated from the ethyl chlorohydrin excess by low-pressure distillation. ABSTRACT: This article discusses the practical uses of ion exchange polymerization catalysts for the manufacture of epoxy resins and is a supplement to and a continuation in depth of a treatment of the subject which appeared in previous publications. The results obtained so far from the investigation of the ion exchange polymerization of epoxy resins carried out at the Research Institute for Synthetic Resins and Lacquers at Pardubice are surveyed, and it is pointed out that the overall increased importance of epoxy resins, in particular their increased applications in the electrical industry, is due to the possibility of hardening them by ionization polymerization. They are suitable for use in cast resins, in insoluble lacquers, impregnation resins, in glues,

Changes in the composition of serum proteins in pregnancy. Z. Stary, P. Bursa, O. Tezok, and R. Cindl (Univ. F-tanbul). *Hoppe-Seyler's Z. physiol. Chem.* 288, 55-61 (1951).—The individual serum protein fractions contain prosthetic carbohydrate groups. The hexose (I) and acetylglucosamine (II) units which make up the carbohydrate portion can be detd. by pptg. the protein, hydrolyzing, and detg. I and II concns. in the hydrolyzate. Normally serum contains 170-200 mg. polysaccharide per 100 cc., of which  $\frac{2}{3}$  is I and  $\frac{1}{3}$  is II. Serum protein-bound carbohydrate is also much greater than free serum glucose. In the last trimester of pregnancy protein-bound carbohydrate increases markedly although serum protein concn. is diminished. Serum protein-bound carbohydrate consists of 2 separate types: (a) glycoprotein which by salt fractionation is found in the albumin portion and (b) the globulin portion contg. 4.5% carbohydrate. In pregnancy the serum protein carbohydrate rise occurs in the albumin fraction and is double the normal value, while the albumin fraction itself is somewhat diminished. No significant alteration occurs in the globulin carbohydrate fraction. Bernard Klein

mary. Abs. in *Chem. Abstr.*, xxxv, 11, p. 3681, 1941.]

The various strains of *Bacterium* [*Pseudomonas*] *mori* isolated from  
samples of mulberry leaves from the Ukraine, Crimea, and other  
regions of the U.S.S.R. [see preceding abstract] were found to be  
identical in their morphology, physiology, and agglutinative action,  
and to correspond with the description of the organism given by  
[E. F.] Smith (*Science*, N.S., xxxi, p. 792, 1910). Cultures of *P. mori*  
remain stable and retain their virulence at a temperature range of  
0° to 30° C. for a lengthy period, which is curtailed by warmer con-  
ditions or desiccation. Infection is not seed-borne, but may overwinter  
in diseased foliage in the soil and spread during the next growing season.

STARBUIGINA (ММЕ L. P.) & SHISHELOVA (ММЕ N. A.). Возбудители мягкой гнили семенников Капуста. [Agents of soft rot in Cabbage grown for seed.]—*Микробиология* [*Microbiology*], 17, 2, pp. 160-170, 1 pl., 1948. [Received June, 1949.]

The results of experiments carried out at the Moscow Department of the Pan-Union Institute for Agricultural Microbiology demonstrated that most of the bacteria causing soft rot in cabbage were pathogenic in varying degrees to potato tubers, carrot roots, and cabbage and potato seedlings. When grown on nutrient medium the cultures were characterized by the instability of their morphological-cultural characters (shape of colonies and cells, colour, and growth) besides the differences in pathogenicity. Many agreed with the causal organism of black leg [*Erwinia phytophthora*: *R.A.M.*, 27, p. 119], isolated from a potato stem, but the majority can be tentatively referred to as *Bacterium carotovorus* [*E. carotovora*: *ibid.*, 28, p. 306].

RUDAKOV (K. I.), STARUGINA (Mme. L. P.), & SHISHKOVA (Mme. N. A.). МЯКАЯ ГНИЛЬ ОВОЩЕЙ. [Soft rot of vegetables.] Докл. АКАД. Сельского. Наук Ленинна [Rep. Lenin Acad. agric. Sci.], 1950, 10, pp. 25-28, 1950.

In the cabbage-growing regions of central U.S.S.R. the plants and especially the seeds are attacked by soft rot due to *Kirvinia carotovorae* (R.A.M., 28, p. 555), which is difficult to control, and to *Bacillus mesentericus*, *B. subtilis*, and especially *B. polymyxa* [cf. *ibid.*, 29, p. 85]. The latter group causes rot only at temperatures over 35° C. and of the aerial parts only; they are infected from the soil by the contact of the lower leaves or by insects. The most effective measures for controlling rot by the latter group are the lowering of the temperature of the soil and preventing its contact with the lower leaves as well as avoiding unfavourable conditions of nutrition, removing the lower leaves of year-old cabbage, and the destruction of cabbage insects.

TITLE : Soft rot in Vegetable Crops and Control Measures.

ORIG. PUB.: Evol. mikrobiologiya, inform. po s.-kh. mikrobiol., 1957, No. 2, 24-26

ABSTRACT : It has been determined by the authors that soft rot can be caused, besides by Erwinia carotovora, by soil saprophytes as well: (Pseudomonas fluorescens, Rac. polymyxa, Bac. mesentericus, Bac. pumilus, and others). These bacteria were discovered within the tissues of outwardly healthy plants. In distinction to Erw. carotovora the proteoglycanase activity are widely distributed in soils and are consistently found in plant remains. In

AUTHORS: Afrikyan, E. K., Kuchayeva, A. G., Candidates of Biological Sciences

TITLE: Use of Antibiotics in Plant Cultivation (Primeneniye anti-biotikov v rasteniyevodstve)

PERIODICAL: Vestnik Akademii nauk SSSR, 1959, No. 1, pp 142-145 (USSR)

ABSTRACT: A conference dealing with this subject took place in Yerevan from 10-13 October, 1958; it had been called by the Institute of Microbiology of the Academy of Sciences of the Republic of Armenia. The Institute of Microbiology of the Academy of Sciences of the Republic of Armenia, the Institute for Agricultural Microbiology of the VASKhNIL and the Sector of Microbiology of the Academy of Sciences of the Armenian SSR.

M. Kh. Tutyazyan spoke about microbes available which promote the development of higher plants. N. M. Picholishko reported on investigation of several years' duration carried out by Mirnina on the use of antibiotics in plant and its utilization in the fight against agricultural pests. V. N. Zaitsev, E. K. Kuchayeva dealt with the utilization of the fungus Trichoderma in fighting the diseases of cotton bushes, potatoes and some other agricultural breeds. E. C. Mirzabekyan's report dealt with the excretions of actinomycetes which produce active antibiotics against the carriers of potato wart disease and diploidia in maize.

S. Dzyubayeva, Y. M. Marmina spoke about the utilization of the actinomycetes antagonists in fighting potato ring rot and mucous bacteria in cabbage. G. E. Eshbayeva reported on the effect of preparations from cultures of actinomycetes to prevent the development of cotton diseases. A. G. Kuchayeva, M. K. Picholishko, E. K. Kuchayeva, V. M. Mikulina, M. K. Kuchayeva, D. E. Shirokov, A. D. Malbandyan dealt with the utilization of epiphytic microflora in fighting several fungus diseases in plants. D. M. Zhakhchyan, E. L. Indonozhaya, M. P. Shtaygina, M. G. Guevteryan mentioned results obtained in investigations of phytoantibiotics as well as its utilization in fighting diseases occurring in cotton bushes and maize.

E. M. Gakhalyan, Ya. P. Zorianka, A. G. Kuchayeva, M. A. Zhukovskaya tried the effect of antibiotic preparations as insecticides against bacterial cankers in fighting diseases of plants. Ya. Ya. Babik, K. M. Balyuzhaya described the investigation of plant antibiotics. Z. E. Babker, A. V. Kilayev spoke about the production of the preparations "griseofulvin" and "trichostatin" and their effect on fungus carriers of diseases in cabbage, wheat and water melons. A. G. Kuchayeva reported on results achieved in the utilization of antibiotics against unpaired wild moths.

L. P. Starogina, E. M. Kuchayeva, M. K. Kuchayeva dealt with the formation of phytoantigen forms of bacteria resistant to antibiotics. M. A. Yindokraya, E. M. Kuchayeva described a method of rapid determination of the effect of antibiotics on plants. The results of the conference found the work carried out in this field in the Republic of Armenia. The organization of an industrial production of antibiotics and microbe preparations for the purpose of their large-scale practical introduction in agriculture was pointed out as necessary. The necessity of an intensification of joint investigations of the Academy of Sciences and the development of plants of microbial origin with stimuli pointed out. The importance of coordination of work for further research and utilization of antibiotics in plant breeding was emphasized as well as the holding of periodical conferences dealing with this problem.

TITLE: Electrical properties of PbTe with bismuth impurities

SOURCE: Ukrayins'kyi fizychnyy zhurnal, v. 11, no. 3, 1966, 265-270

TOPIC TAGS: lead compound, telluride, electric conductivity, Hall constant, electron mobility, hole mobility, Hall mobility, carrier density, activation energy, valence band

ABSTRACT: The electrical properties of single crystals of PbTe alloyed with bismuth are investigated. The crystals were grown by the Bridgman method. Introduction of  $\sim 10^{19}$  atoms/cm<sup>3</sup> of bismuth resulted in n-type conductivity with a carrier density of about  $10^{19}$  cm<sup>-3</sup>. At lower bismuth concentrations the lower portion of the crystals has p-type and the upper portion n-type conductivity. Similar results were obtained with zone refining, indicating that the bismuth distribution was nonuniform. In samples cut from the same crystal, the bismuth content may have increased on approaching the n-type region. The electrical conductivity and Hall coefficient of eight samples were measured by standard dc methods. Measurements were also made using PbTe samples with impurity levels produced by bismuth

and donor levels produced by excess lead. The hole density in all n-type PbTe samples with bismuth impurities was of the order of  $3 \times 10^{18} \text{ cm}^{-3}$  regardless of the bismuth concentration. The Hall mobility and its temperature dependence was the same as for unalloyed crystals. A slight increase in the Hall coefficient and a rather considerable decrease in the Hall mobility were noted in crystals cut out near the p-n junction. Upon annealing, the conductivity of p-type samples decreased, the Hall coefficient in the impurity region increased, and the inversion temperature shifted to lower values. The Hall mobility increased with decreasing temperature like  $T^{-2.6}$ . In some samples prolonged annealing at 165C results in a change from p-type to n-type conductivity. It is found that alloying of PbTe with bismuth produces both shallow donor levels with activation energy  $\Delta E = 0$  and comparatively deep acceptor levels at  $\Delta E = 0.065 \text{ eV}$  above the valence band. Annealing at 160C leads to a decrease in the concentration of deep acceptor levels. The author thanks Candidate of Phys.-Math Sciences, K. D. Tovstyuk, and the senior scientist P. I. Voronyuk for assistance with the work and valuable advice. Orig. art. has: 5 figures and 4 formulas.

TITLE: "Drilling of Blasting Holes by Pneumatic Drills" by A.L. Skornyakov (A.L. Skornyakov, Prokhodka vzryvnykh skvazhin pnevmoudarnikami)

PERIODICAL: Gornyy Zhurnal, 1957, No 12, p 71 (USSR)

ABSTRACT: This note is a review of the book published by the Metal-lurgizdat in 1957. The reviewer points out that the book under discussion takes up many essential problems which thus far were elucidated in literature only in the form of individual disconnected data. The author succeeded in uniting the results of recent years in drilling deep bore holes for blast operations by means of various pneumatic drills and machines. Some defects and inaccuracies of the book are also pointed out.
